Documentation for GrabToday

The application is currently only in alpha testing mode, and is not being served via the internet. Rather it's a local instance of a django application that runs through the browser. The following document outlines the usage for the application.

Python should be installed and running on your system for using GrabToday. The open source programming language could easily be downloaded and installed on your system. Further, associated libraries should also be installed.
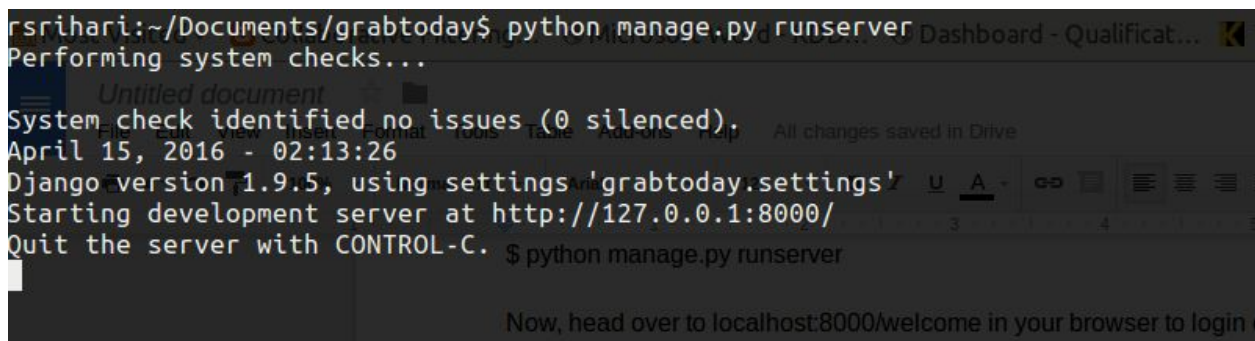

Once the associated libraries are installed, you are ready to run the application. Shift into the folder containing the file manage.py and run the following command.

$ python manage.py runserver

Now, head over to localhost:8000/welcome in your browser to login or sign up.

Once you are logged in, you will receive suggestions on what activities you could engage on in the city. As you rate more and more events or places, the machine will learn your taste better and offer you better suggestions.
